

The ASTRO-H Mission

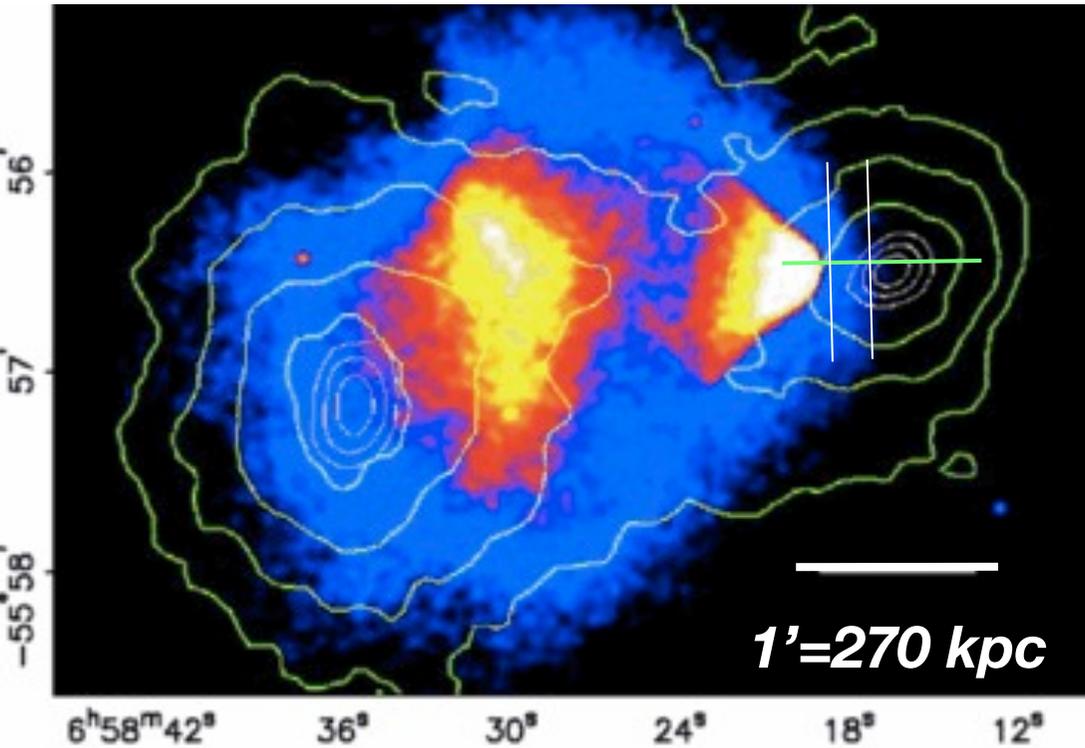

Tadayuki Takahashi
ISAS/JAXA

1. Why we need new X-ray Missions
2. Current Status of ASTRO-H

T. Takahashi

Why we need new X-ray Missions

Violent mergers

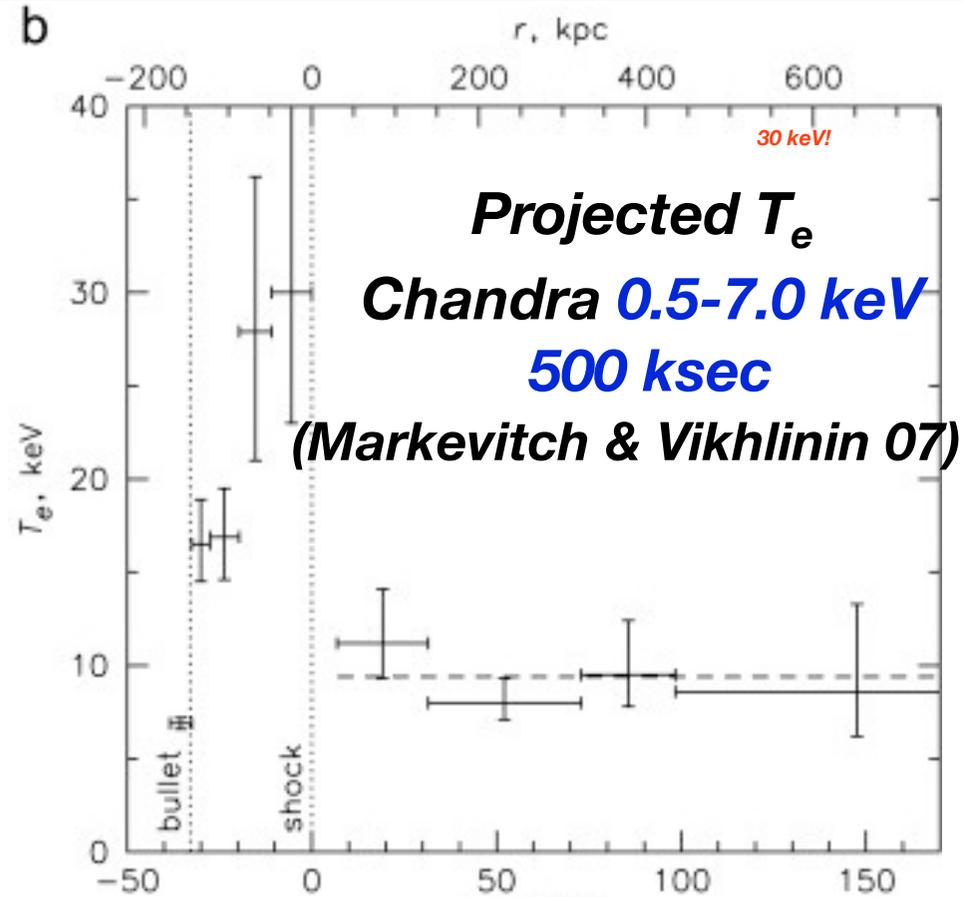

1E0657-56 at $z=0.30$ (Bullet cluster)

Color: X-ray (collisional gas)

Contours: weak lensing

(Clowe; Mastropietro & Burkert 08)

Rankine-Hugoniot relation:

$$\frac{T_2}{T_1} = \frac{[2\gamma M^2 - \gamma + 1][(\gamma - 1)M^2 + 2]}{(\gamma + 1)^2 M^2}$$

Mach number ~ 3.0

$V_{\text{pres shock}} \sim 4700 \text{ km/s}$

$V_{\text{post shock}} \sim 1600 \text{ km/s}$

Why we need new X-ray Missions

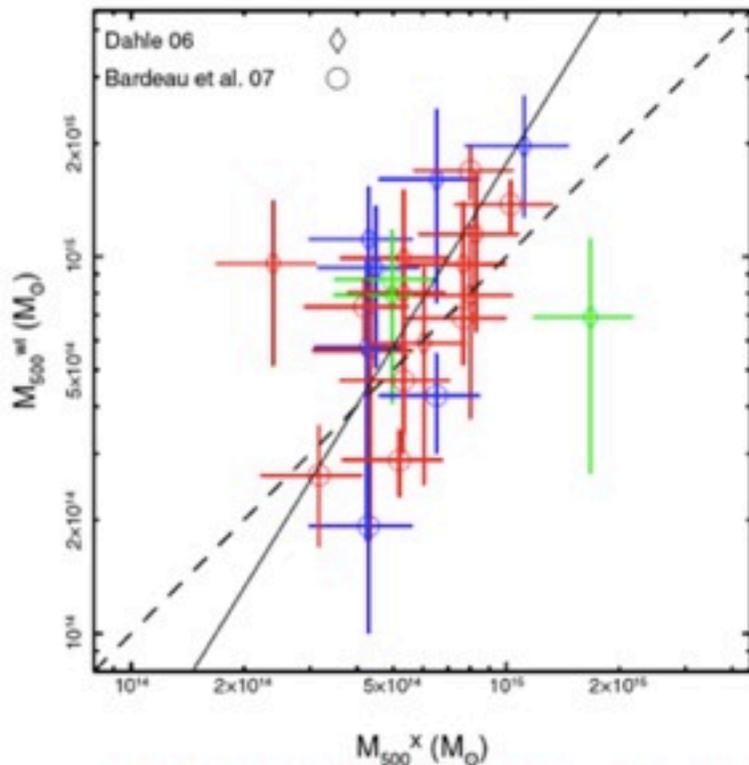

Impacts on the mass determination of galaxy clusters

Mass bias for X-rays :

~ - 12% +- 12%

Numerical simulations show, that this discrepancy can be accounted for by about 10 – 20% extra turbulent pressure

X-ray mass vs Weak Lensing mass

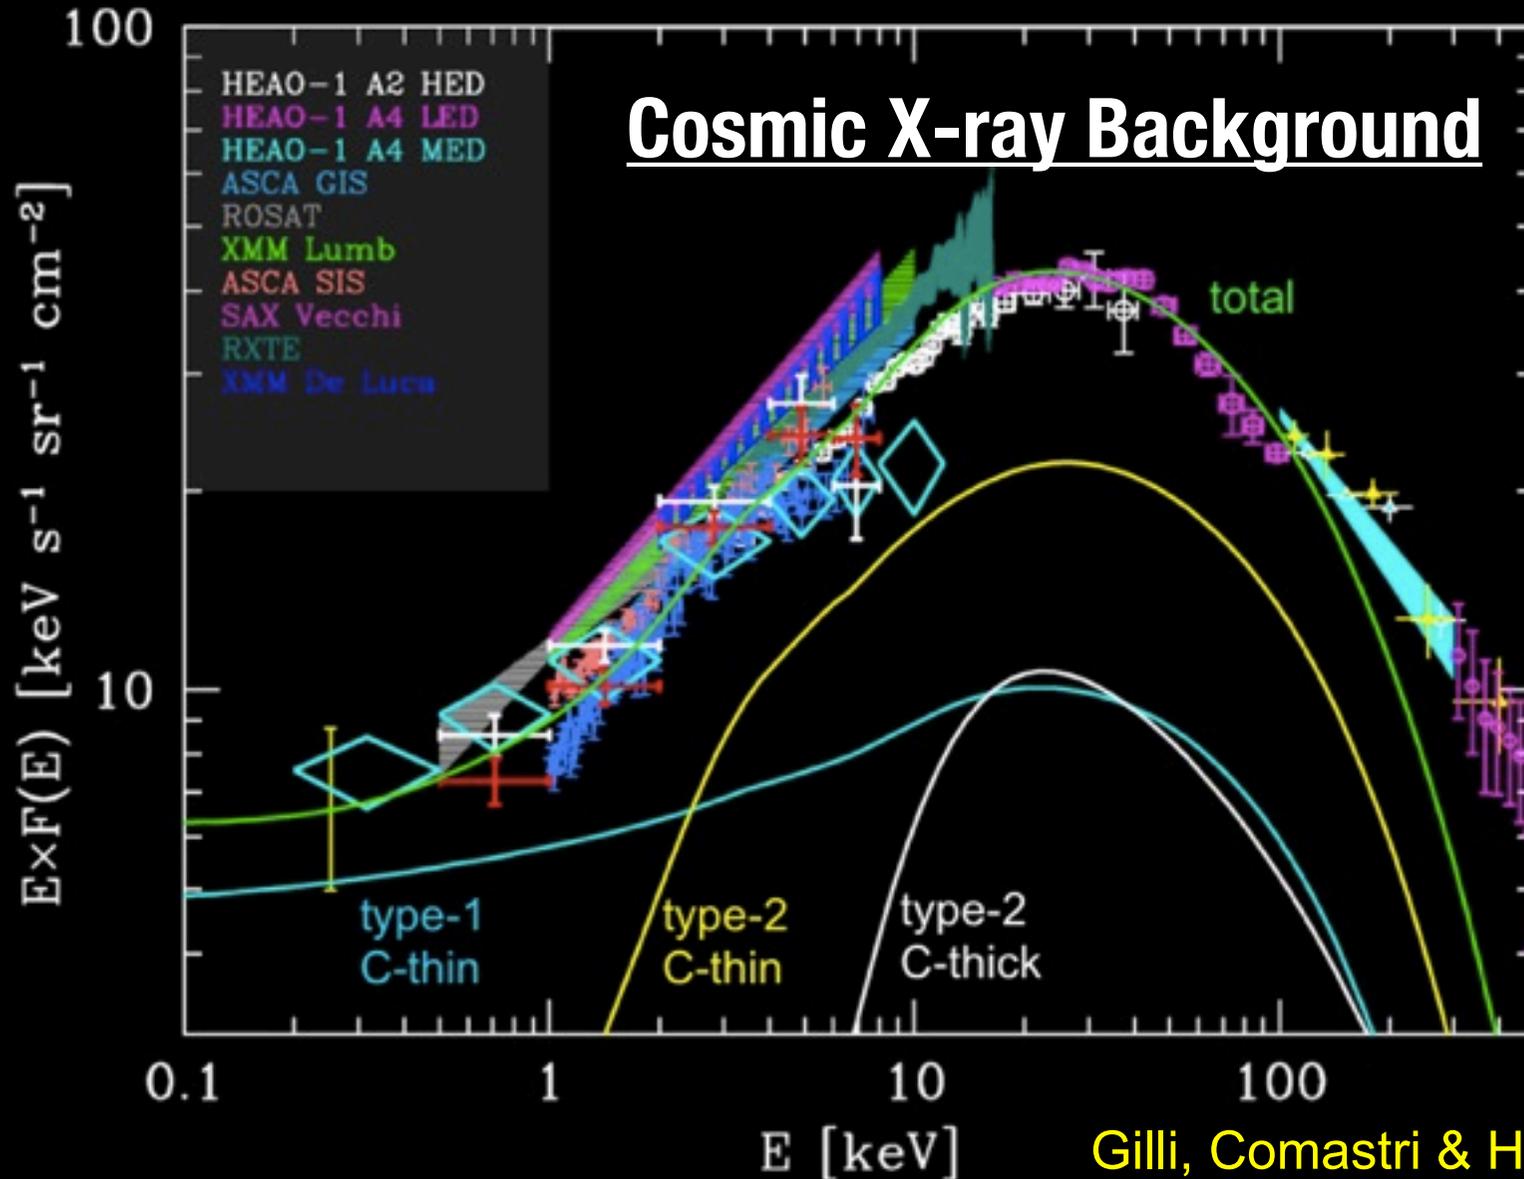

LoCuSS Project (G. Smith et al.)
Zhang et al. 2007

Hydrostatic equilibrium

$$\frac{d(P_{\text{thermal}} + P_{\text{nonthermal}})}{dr} = -\frac{GM(< r)}{r^2} \rho_{\text{gas}}$$
$$\frac{P_{\text{turb}}}{P_{\text{therm}}} = 0.11 \left(\frac{V_{\text{turb}}}{300 \text{ km/s}} \right)^2 \left(\frac{kT_e}{5 \text{ keV}} \right)^{-1}$$

Measurement of **non-thermal pressure support** (gas motions, high energy particles, etc.) by high-resolution or hard X-ray spectroscopy is VERY important

There should be **sufficient number of** type-2 Compton thin/thick AGN above 10 keV, but have not been resolved yet, directly.

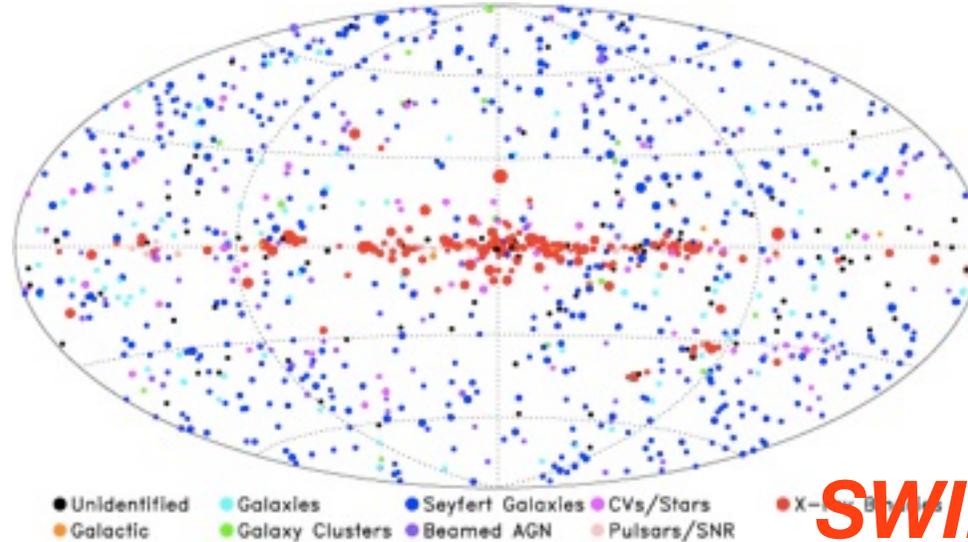

Gilli, Comastri & Hasinger, 2006

Why we need new X-ray Missions

a flux level of 1.1×10^{-11} ergs $\text{sec}^{-1} \text{cm}^{-2}$ over 50% of the sky and 1.48×10^{-11} ergs $\text{sec}^{-1} \text{cm}^{-2}$ over 90% of the sky

Hard X-ray Observations plays a key role

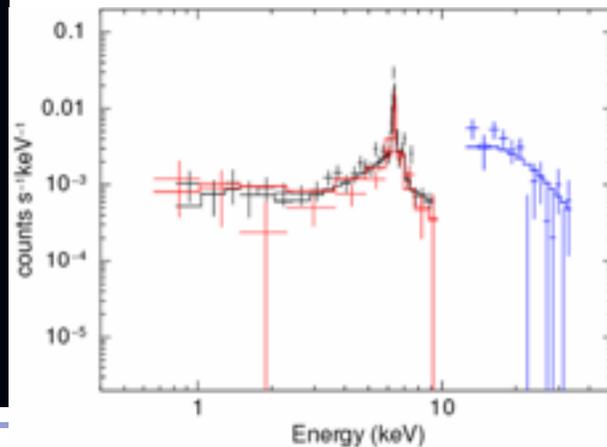

Source Type	# in Catalog
Unidentified	86
Galactic	17
Galaxies	85
Galaxy CLusters	18
Seyfert Galaxies	519
Beamed AGN	108
CVs/Stars	60
Pulsars/SNR	25
X-ray Binaries	174
Total	1092

SWIFT Map

**Swift did a great Job,
but still only a few % of Cosmic X-ray Background
have been resolved in hard X-rays**

Obscured SMBH

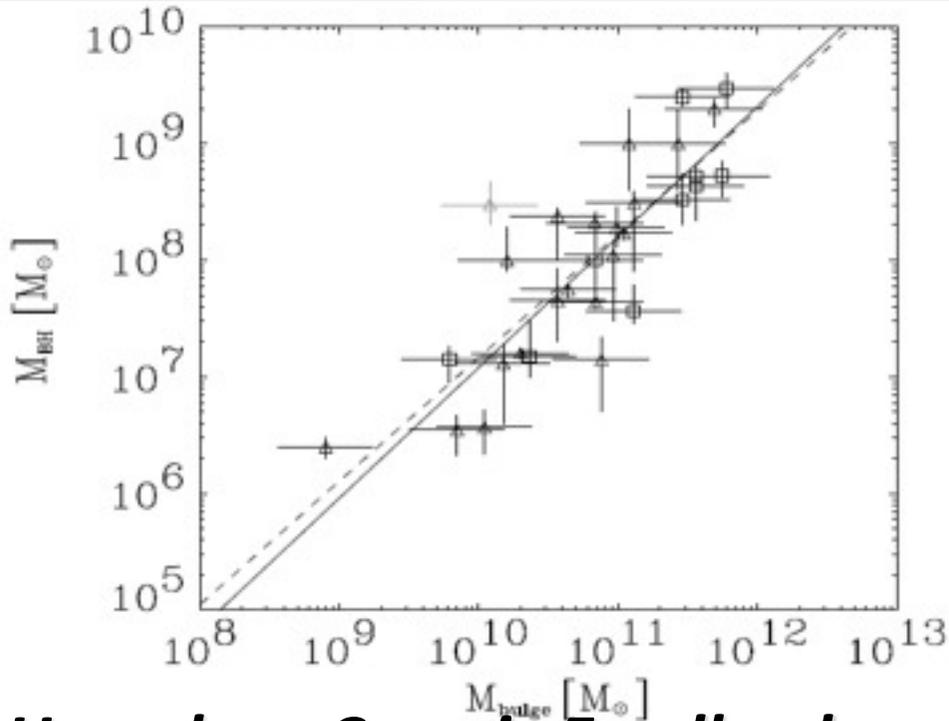

**New type of AGNs discovered
by followup observations by Suzaku
<Deeply buried in dense tori of
gas that they show little emission in
soft X-ray and visible light.>**

Why we need new X-ray Missions

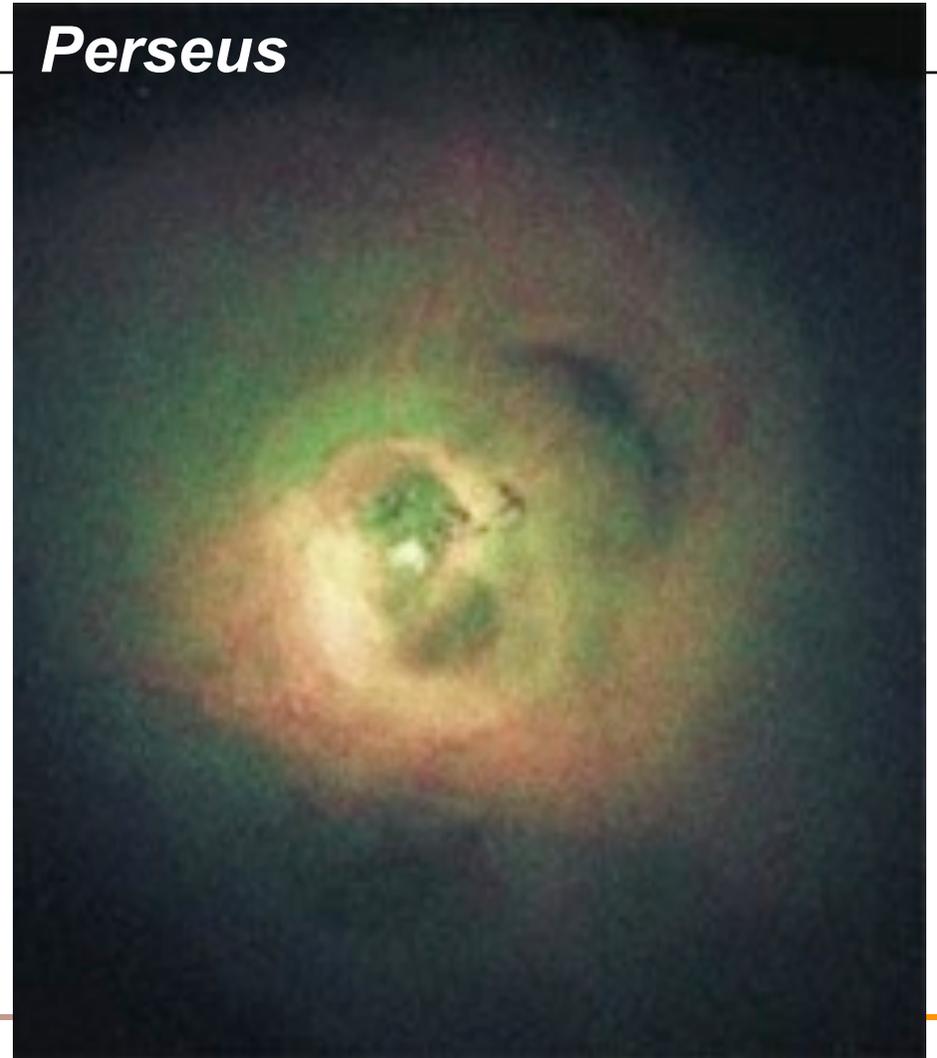

Cosmic Feedback from AGN

Radiative and mechanical heating and pressure from black holes have a profound influence on the evolution of all galaxies whether or not they are in clusters

How does Cosmic Feedback work and influence galaxy formation?

Perseus

ASTRO-H - A New International X-ray Observatory

ASTRO-H is an international X-ray observatory, which is the 6th in the series of the X-ray observatories from Japan. It is currently planned to be launched in 2014 with an H-IIA rocket from the Tanegashima Space Center, Kagoshima, Japan.

Launch site	Tanegashima Space Center
Launch vehicle	JAXA HII-A rocket
Orbit Altitude	550 km
Orbit Type	Approximate circular orbit
Orbit Inclination	< 31 degrees
Orbit Period	96 minutes
Total Length	14 m
Mass	< 2.7 metric ton
Mission life	> 3 years

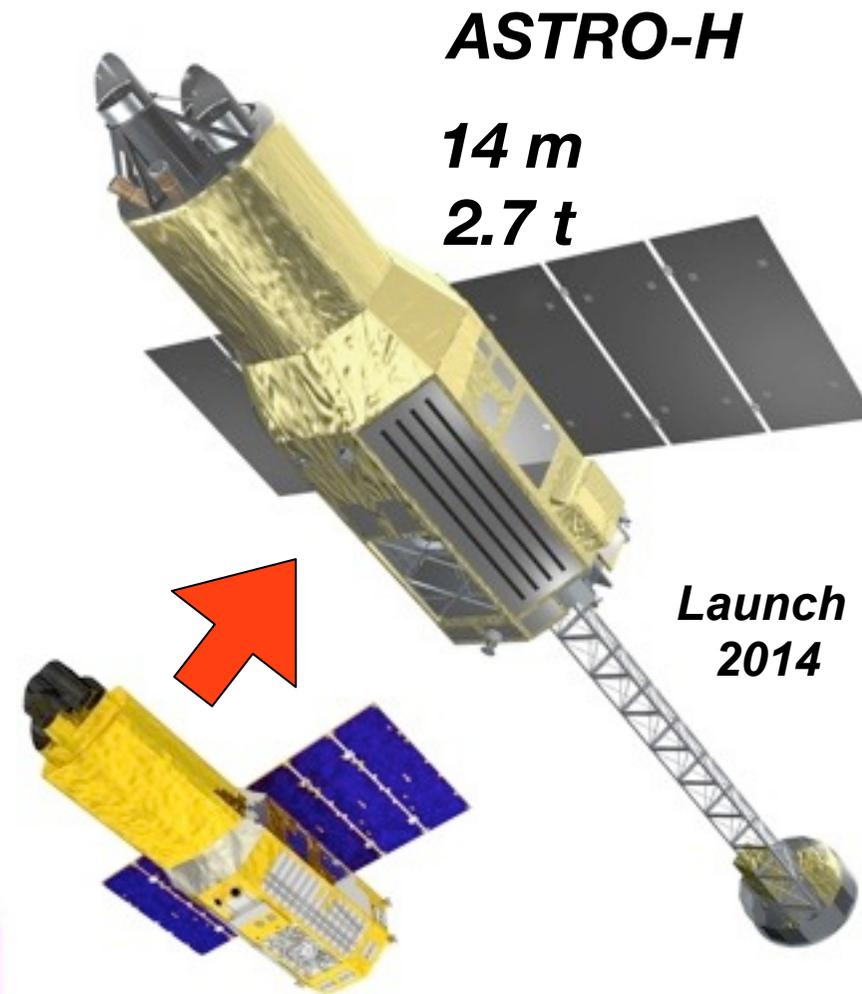

ASTRO-H
(formerly called NeXT)
is now in Phase-C
(Detail Design Phase)

CDR : 2011 June-July
Launch Year : 2014

ASTRO-H as an X-ray Observatory (0.3 - 600 keV)

1. Micro-calorimeter + XRT
0.3-12keV , $\Delta E=5\text{eV}$, FOV=3' ,
 $\Delta\theta=1.3'$
2. Soft X-ray CCD + XRT
0.4-12 keV, $\Delta E=150\text{eV}$, FOV=38' ,
 $\Delta\theta=1.3'$
3. Hard X-ray imager + Hard XRT
5-80 keV $\Delta E < 2\text{keV}$, FOV=9' , $\Delta\theta=1.7'$
4. Soft Gamma-ray detector
100-600 keV no imaging capability

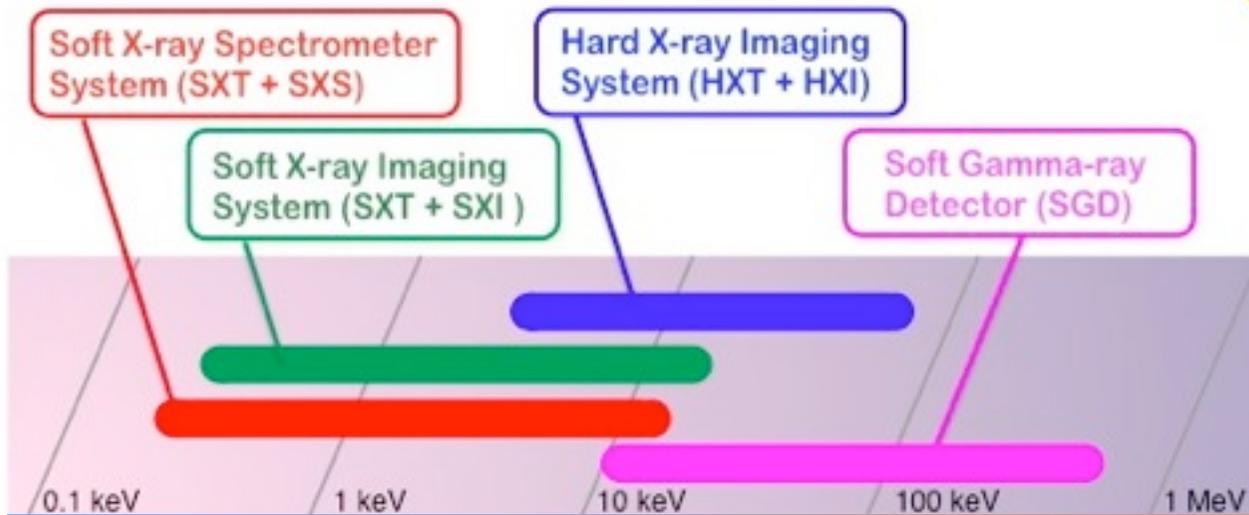

ASTRO-H

2.7 t

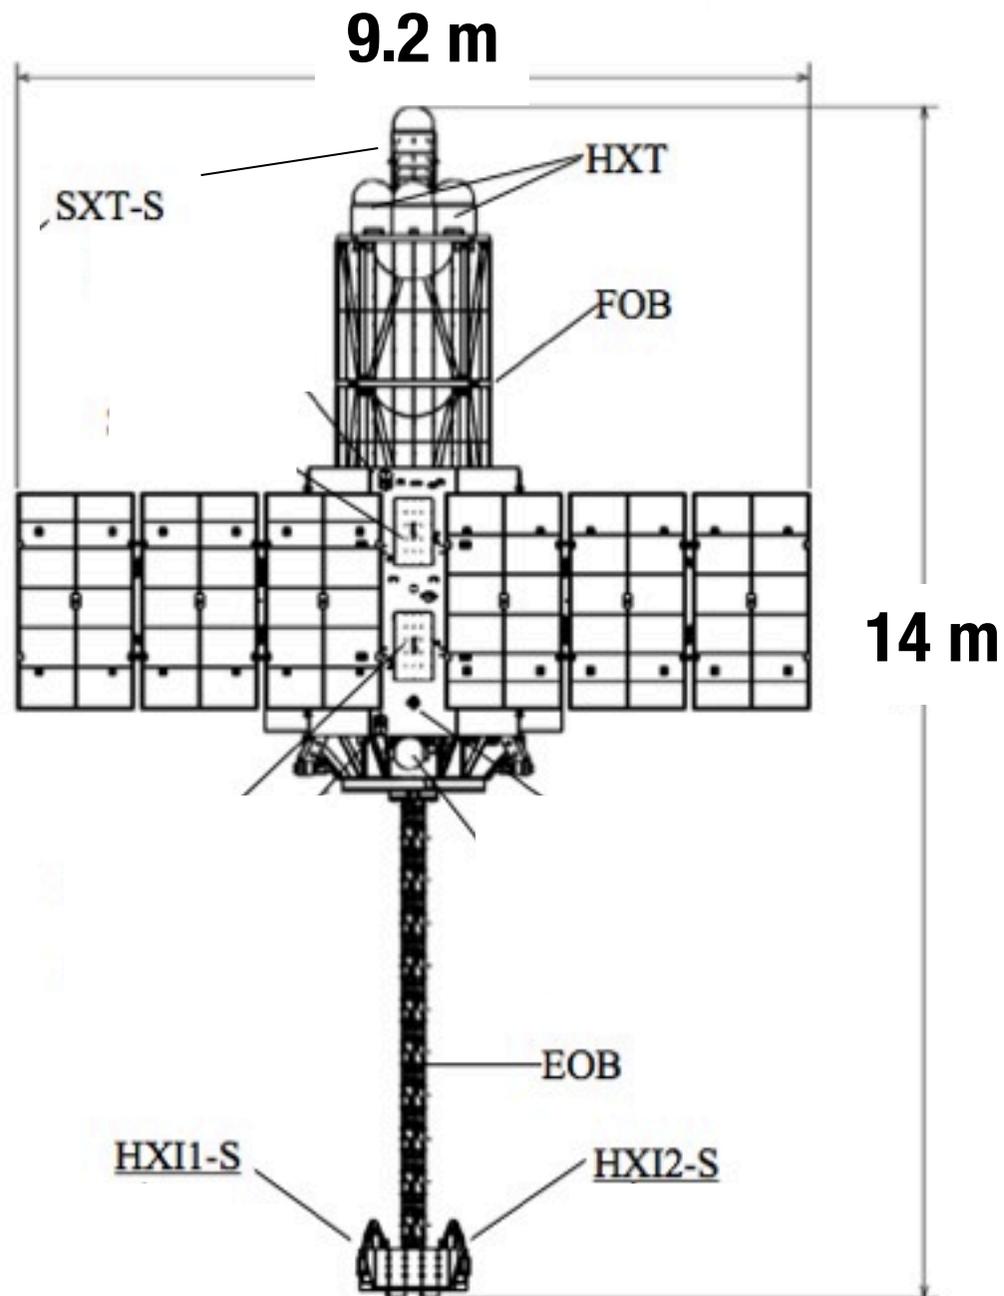

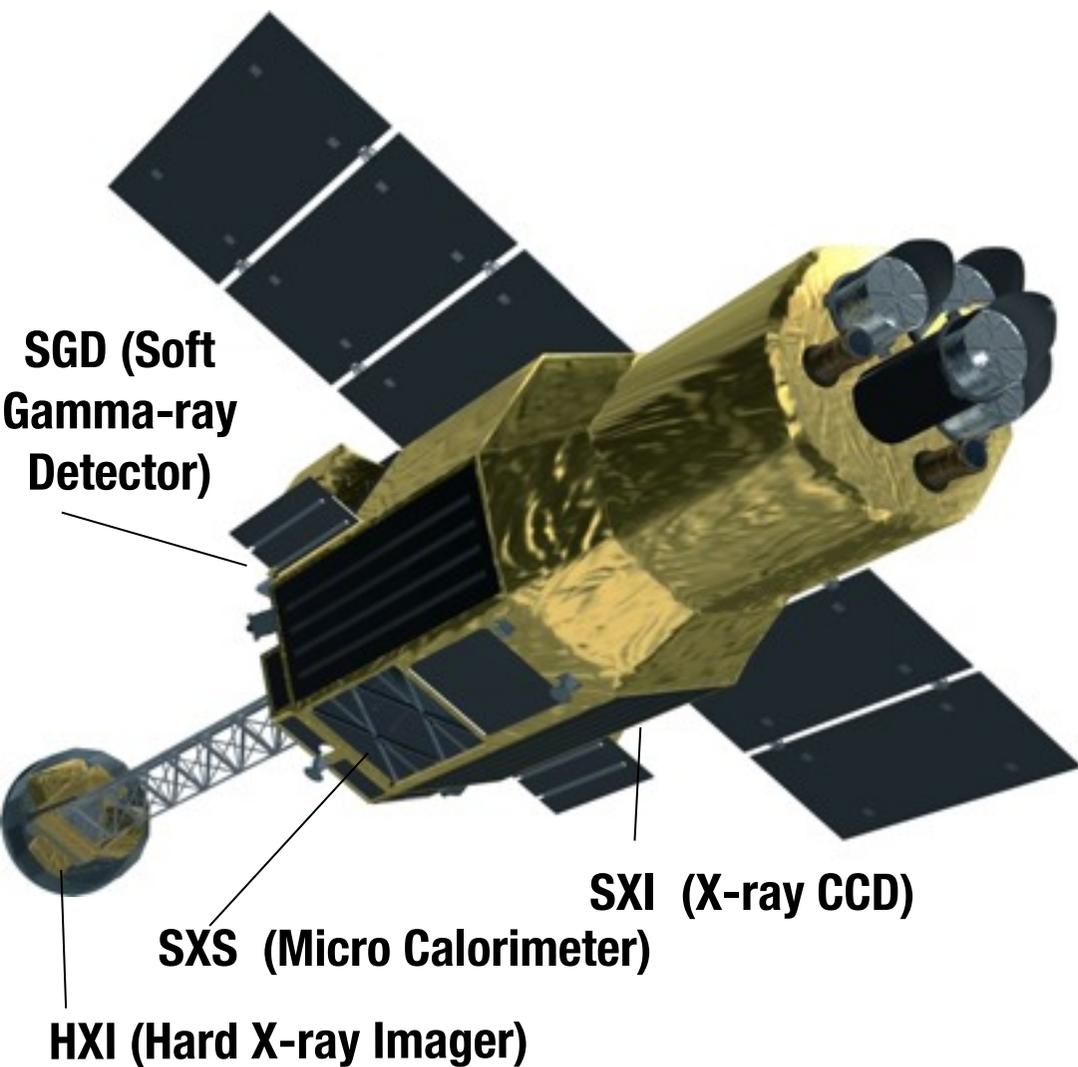

Launch
2014

Suzaku (ASTRO-E2)
(6m, 1.7t)

Launch 2005

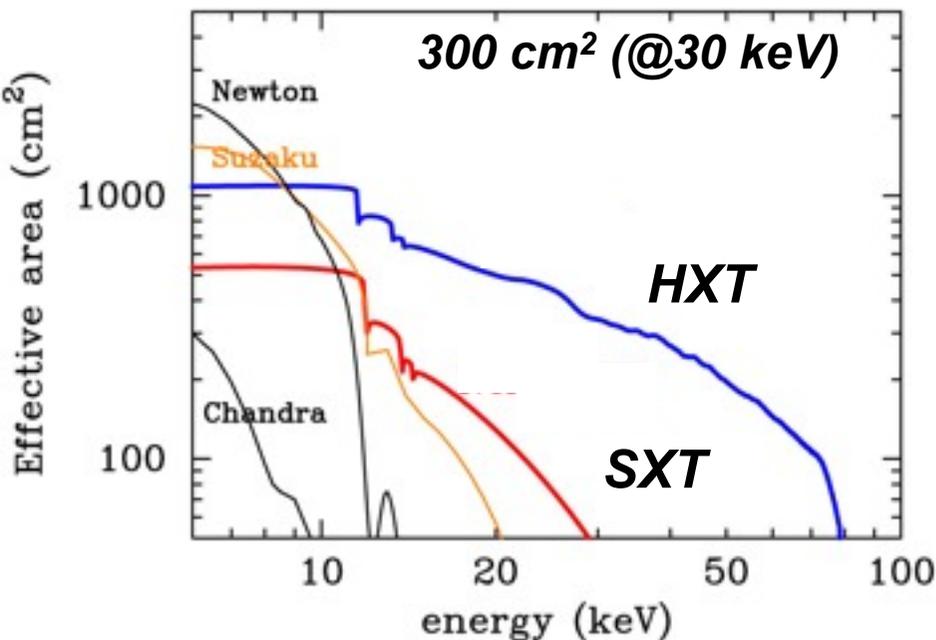

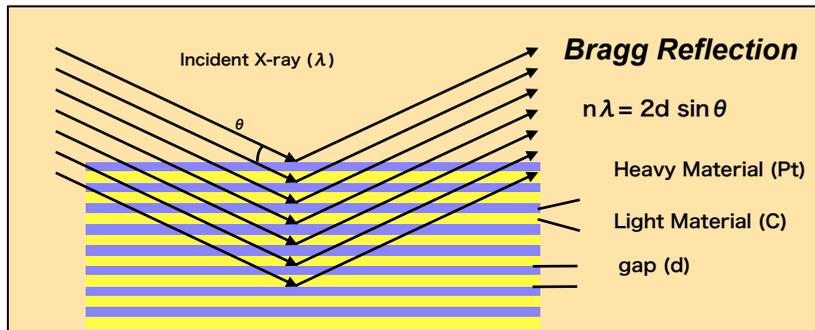

ASTRO-H Configuration

ASTRO-H Hard X-ray Telescope (HXT)

- Pt/C depth-graded multilayer X-ray telescope, original to Japan.
- Large photon collecting area above 10 keV.
- Light-weight design as a heritage of Suzaku.
- Proven technology by balloon experiments.

(1) forming foil

(2) spray epoxy

(3) ML coating

(4) curing

(5) removing

(6) finished ref.

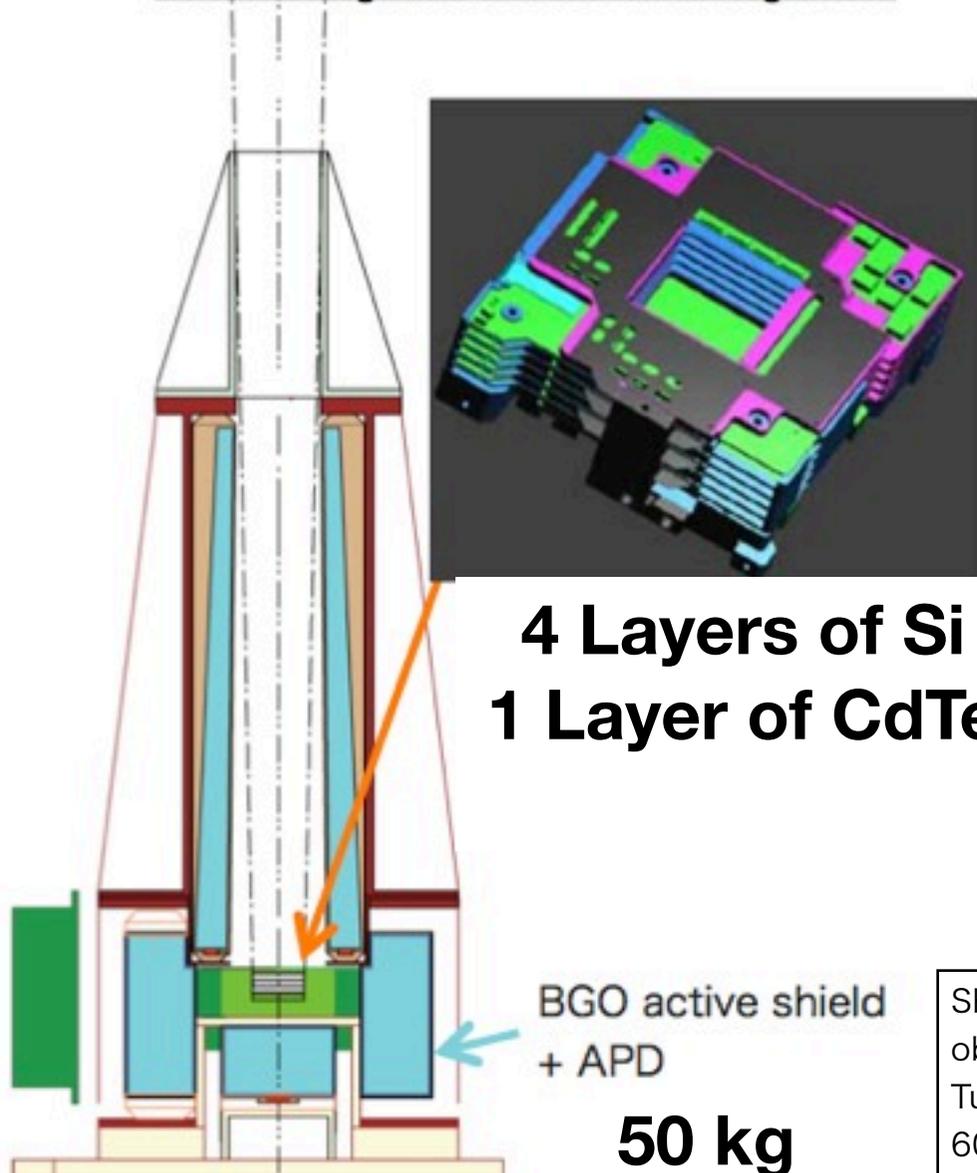

Nagoya/Ehime/ISAS/Kobe/Chuo and more

At Nagoya U.

ASTRO-H Hard X-ray Imager (HXI)

Careful Design to achieve Low Background

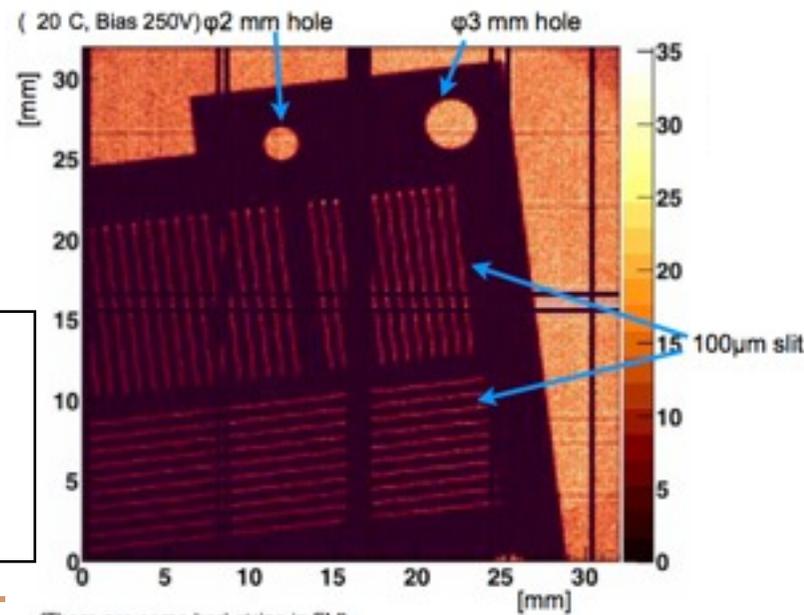

4 Layers of Si
1 Layer of CdTe

BGO active shield
+ APD

50 kg

Shadow image is obtained with a Tungsten slit at 60 keV (^{241}Am) source.

Engineering Model

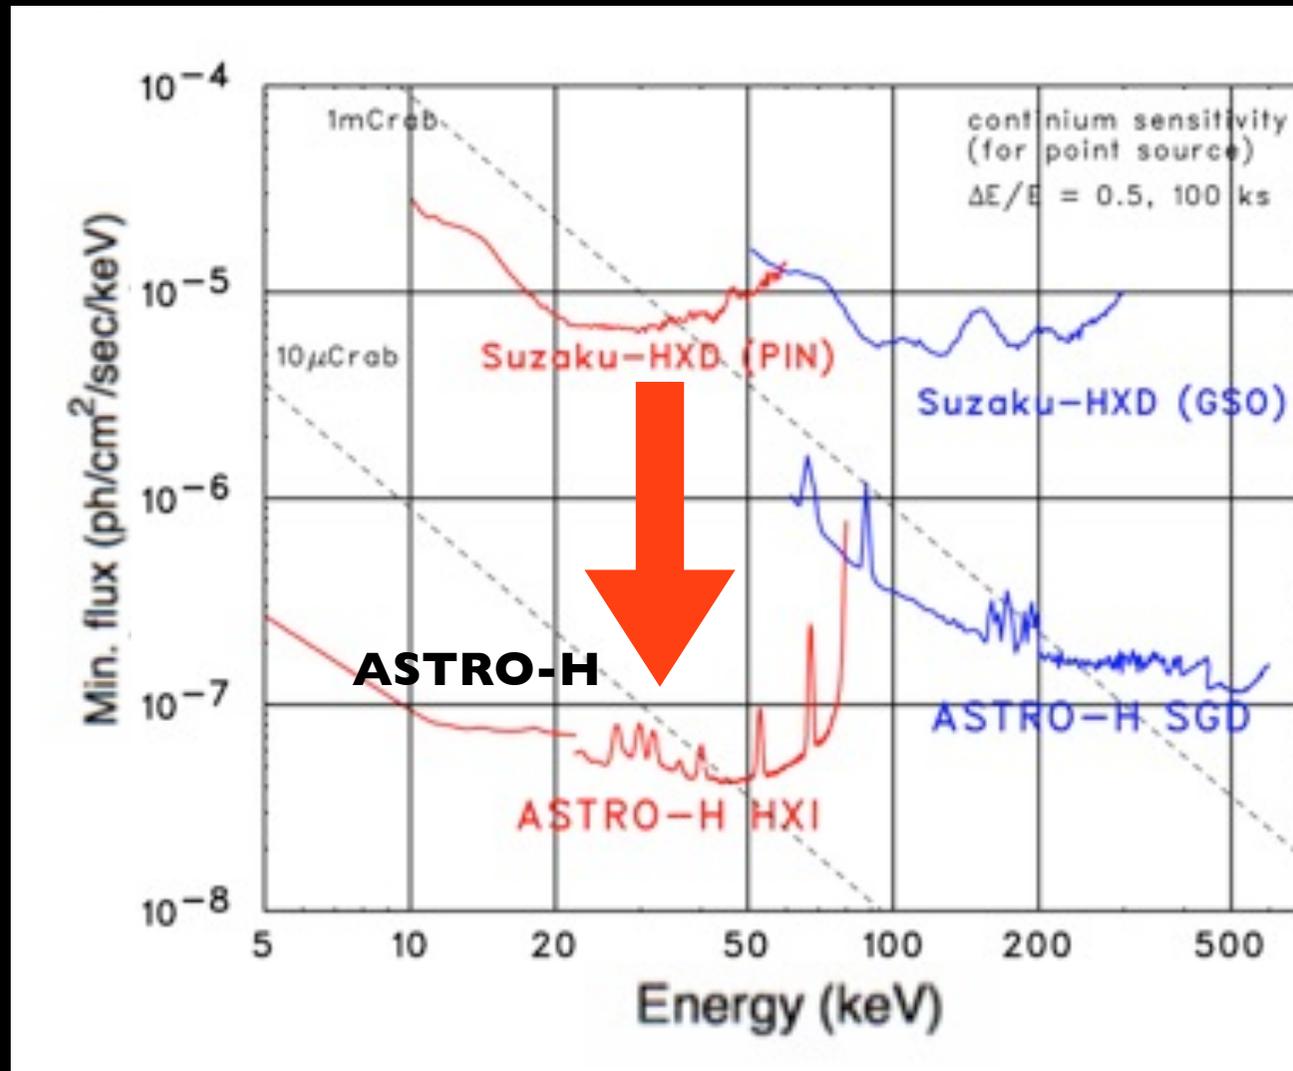

(There are some bad strips in EM)

Power of Hard X-ray Telescope

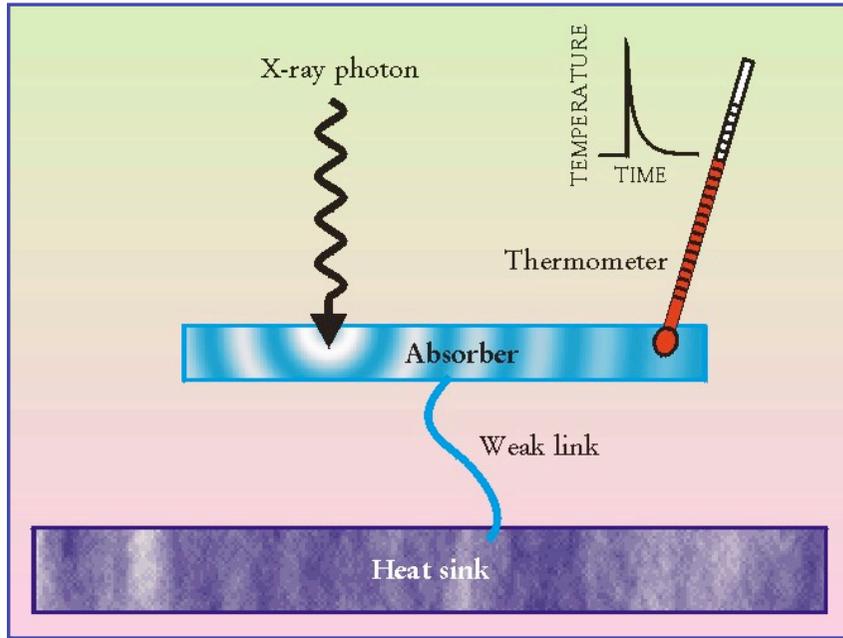

improve sensitivity by $\sim 100x$ over non-imaging missions

Large Collection Area by Mirrors+Small Focal Plane Detector

ASTRO-H Soft X-ray Spectroscopy (SXS)

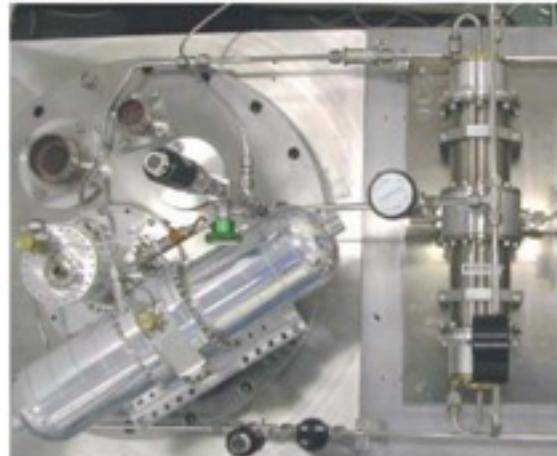

- High Resolution Spectroscopy-
by a micro calorimeter array

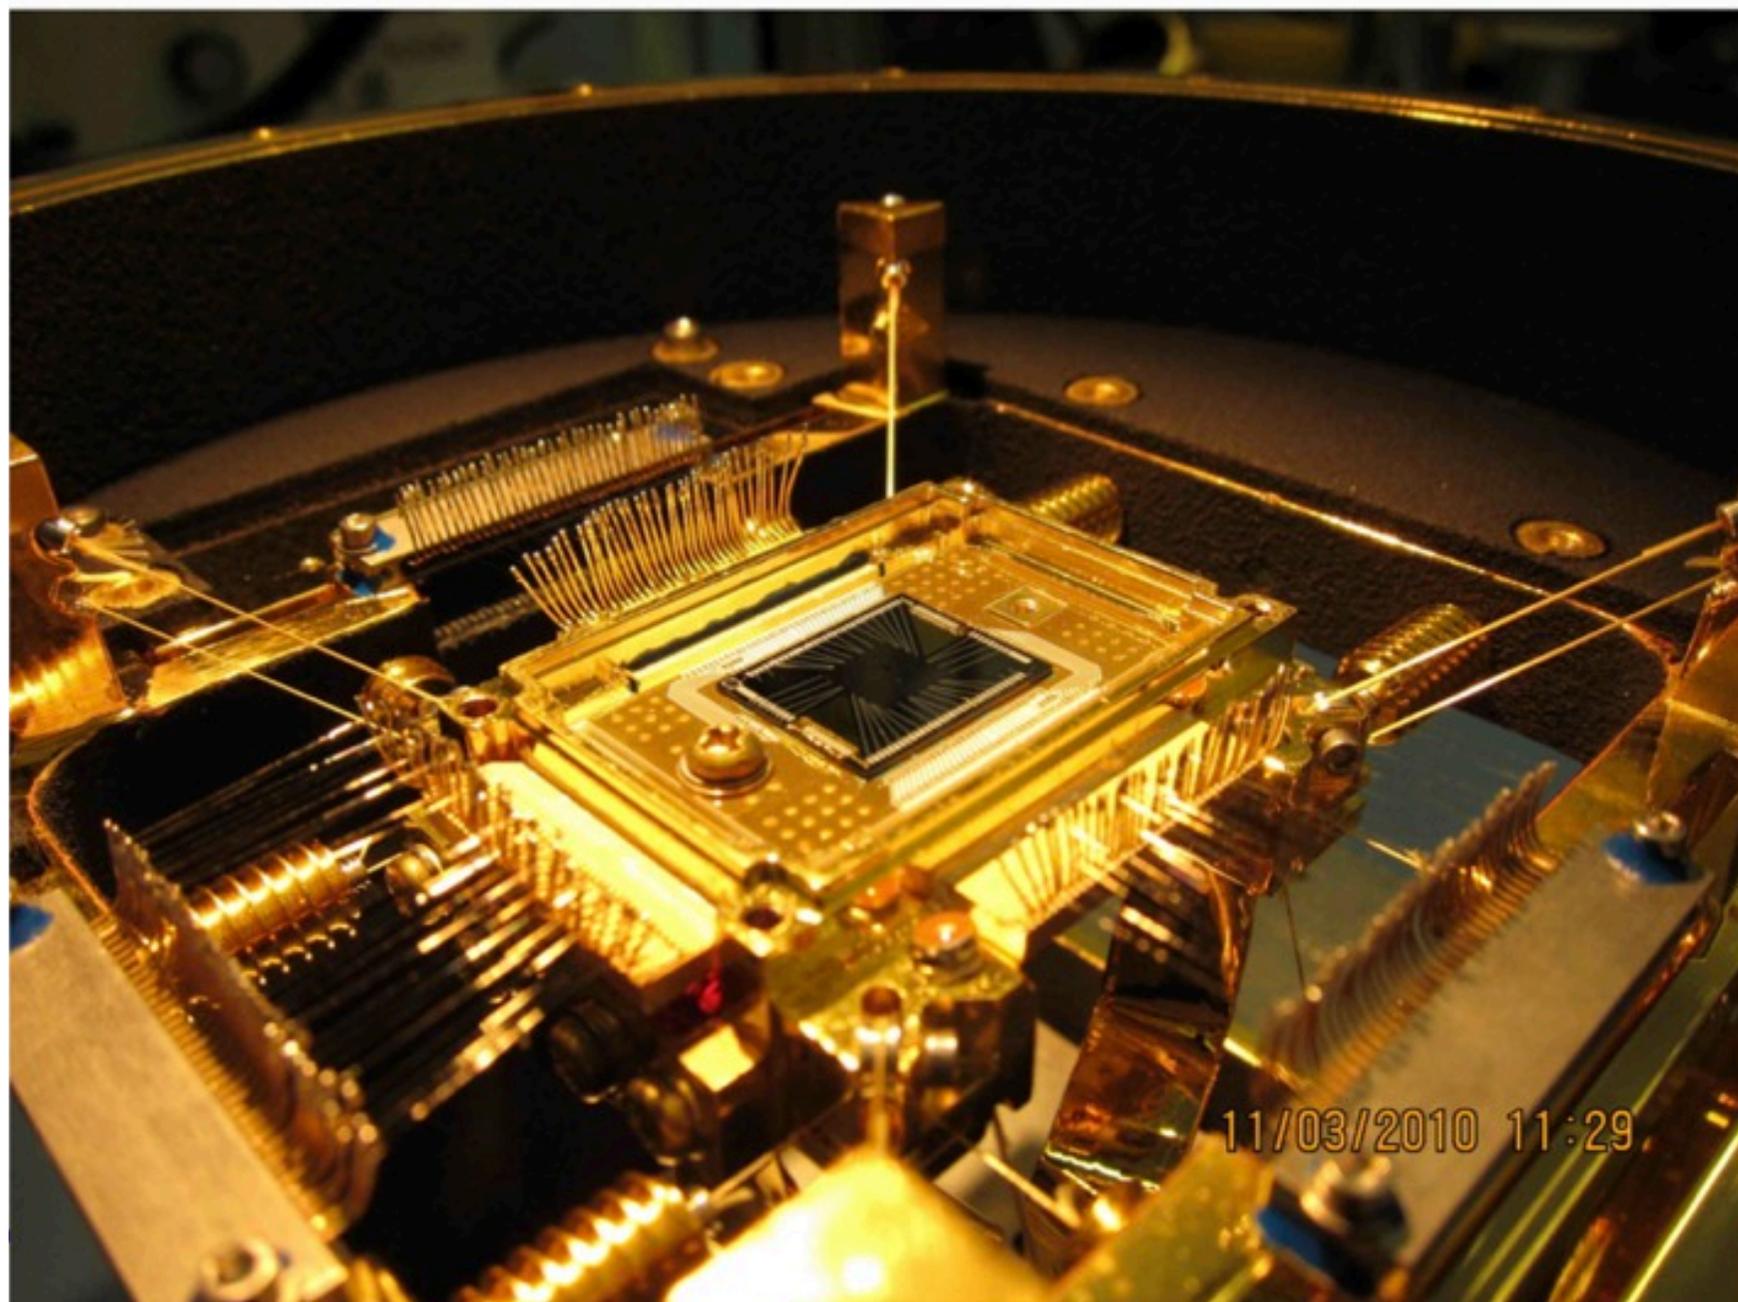

**Detector to be
Operated at 50 mK**

	Requirements (/Goal)
Energy resolution	7 eV (FWHM) (4 eV(FWHM) Goal)
Energy range	0.3 - 12 keV
Field of view	2.9 x 2.9 arcmin
Detector array	6 x 6
Absorber size	800 μm
Effective area	160 / 210 cm^2 (at 1 / 6 keV)

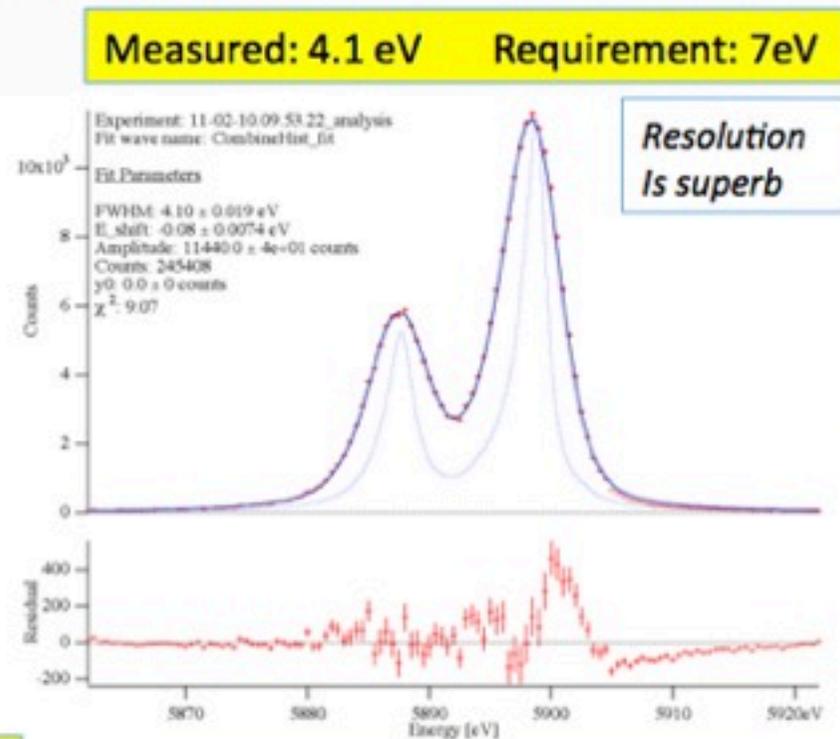

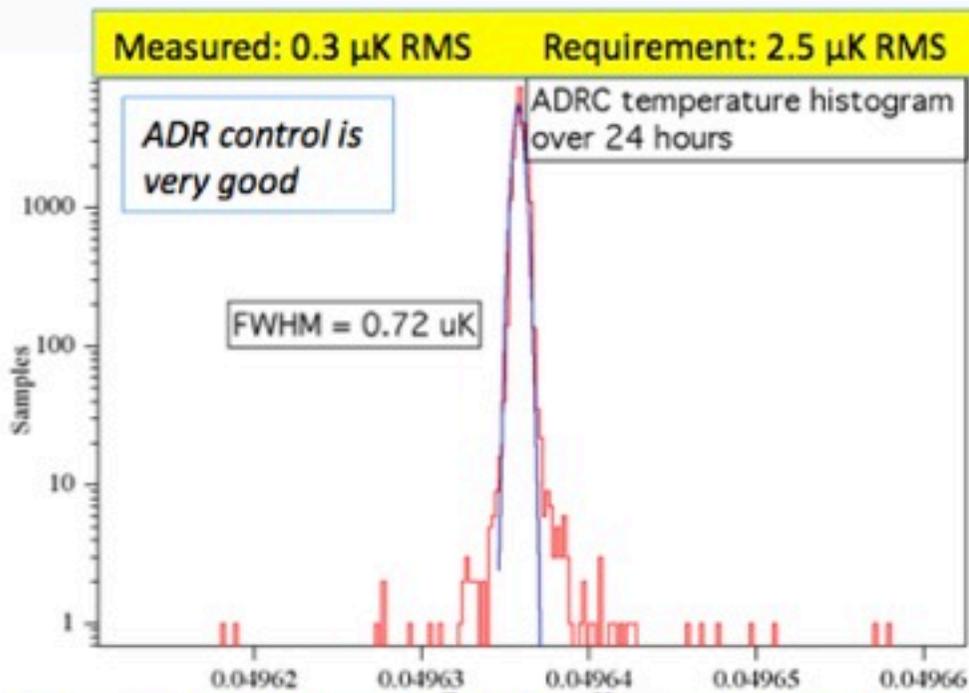

ASTRO-H Coolers/Dewar

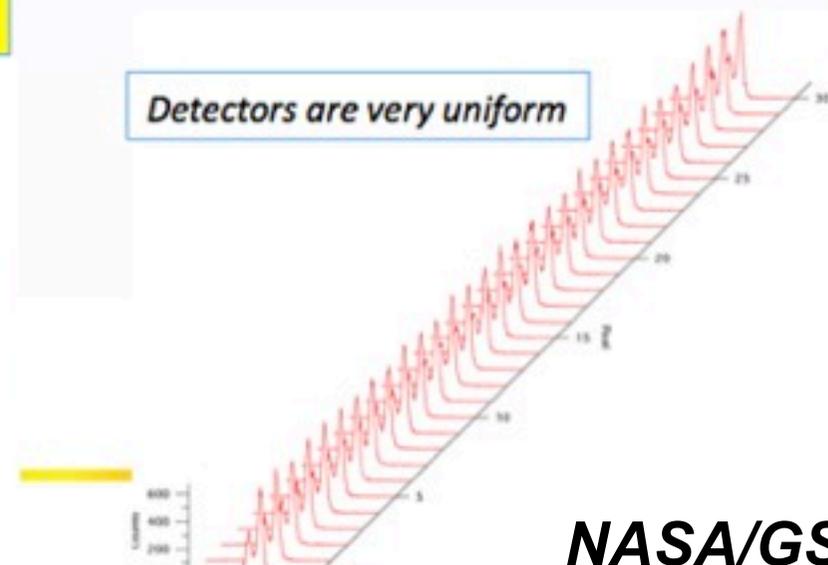

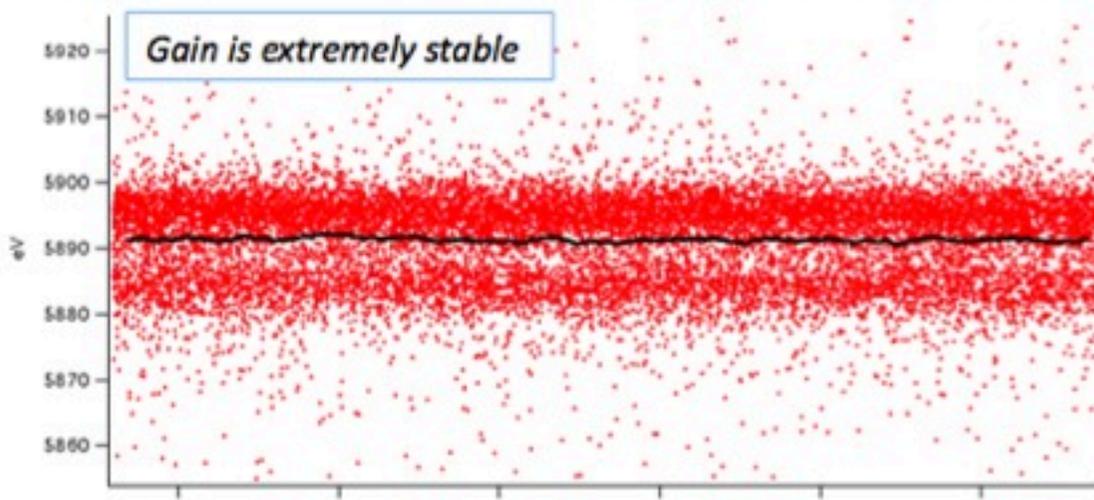

EM Detector System (Detector Assembly + Detector Array + Anti-co Detector)

Recent Results based on the Engineering Model of ASTRO-H

Measured: $\sim 1\text{eV}$ over 18 hr Requirement: $\sim 3\text{eV}$ per 10 min

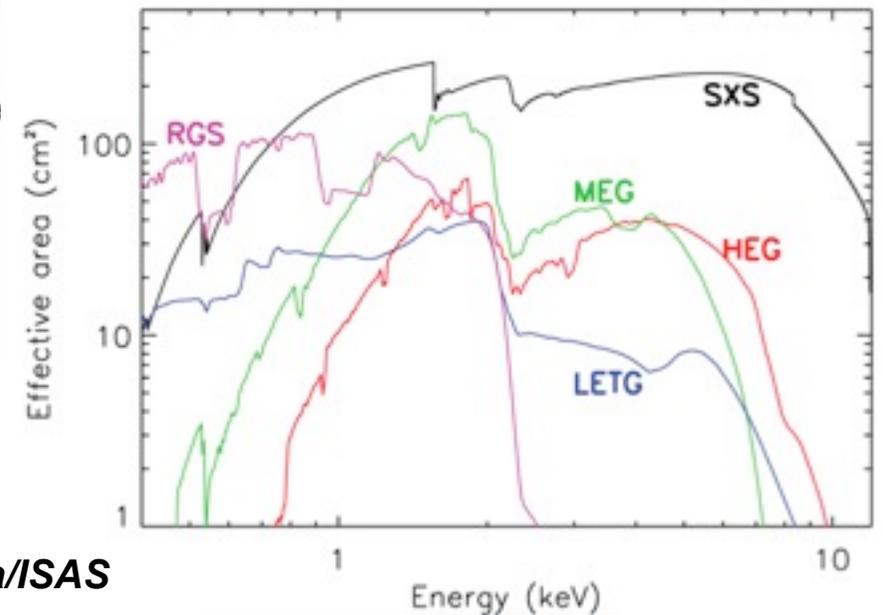

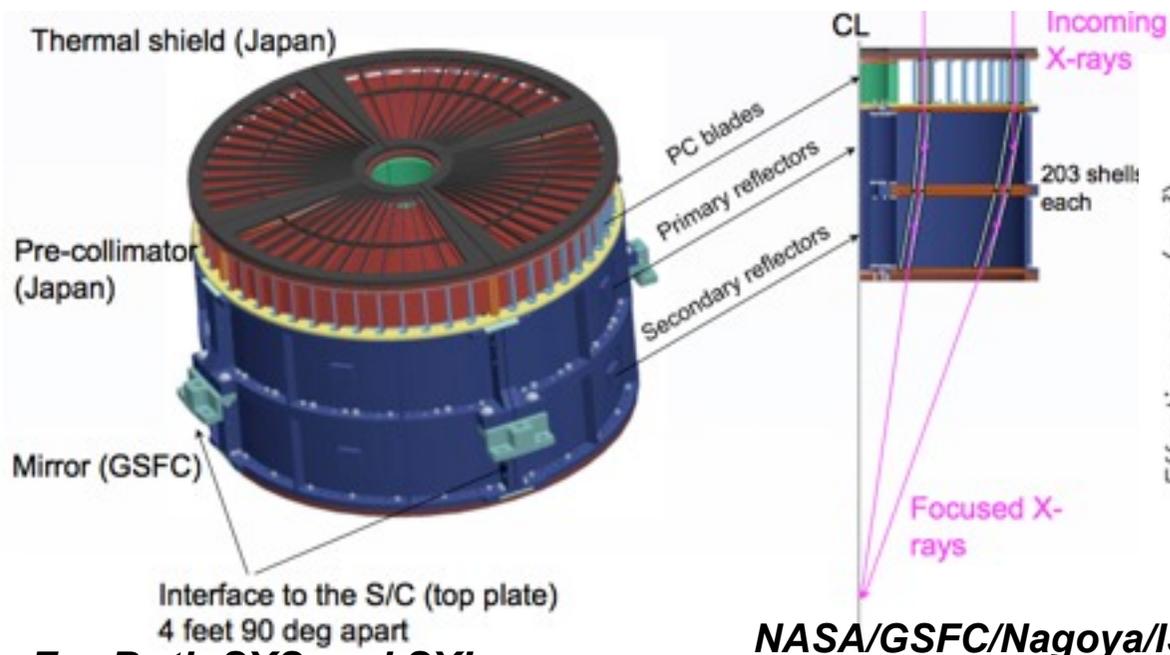

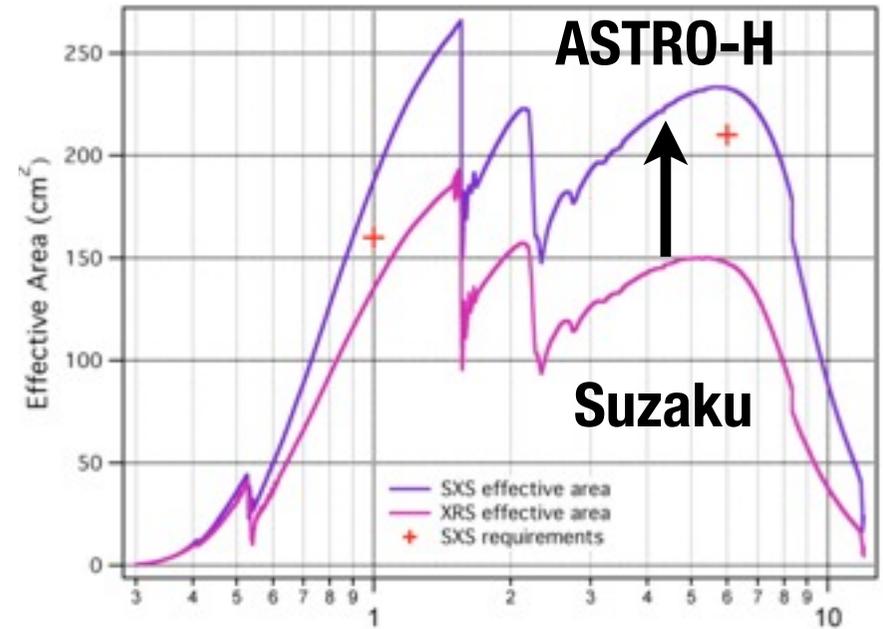

NASA/GSFC

ASTRO-H Soft X-ray Telescope for SXS & SXI

Soft X-ray Telescope (SXT) will be an upgraded version of the Suzaku X-ray telescope (XRT). The diameter and focal length is larger, thus number of the nesting shells are increased.

- (1) thicker aluminum substrate for the larger radii,
- (2) more forming mandrels for better substrate shaping
- (3) precise alignment bars
- (4) glue to fix reflectors on the alignment bars
- (5) stronger housing.

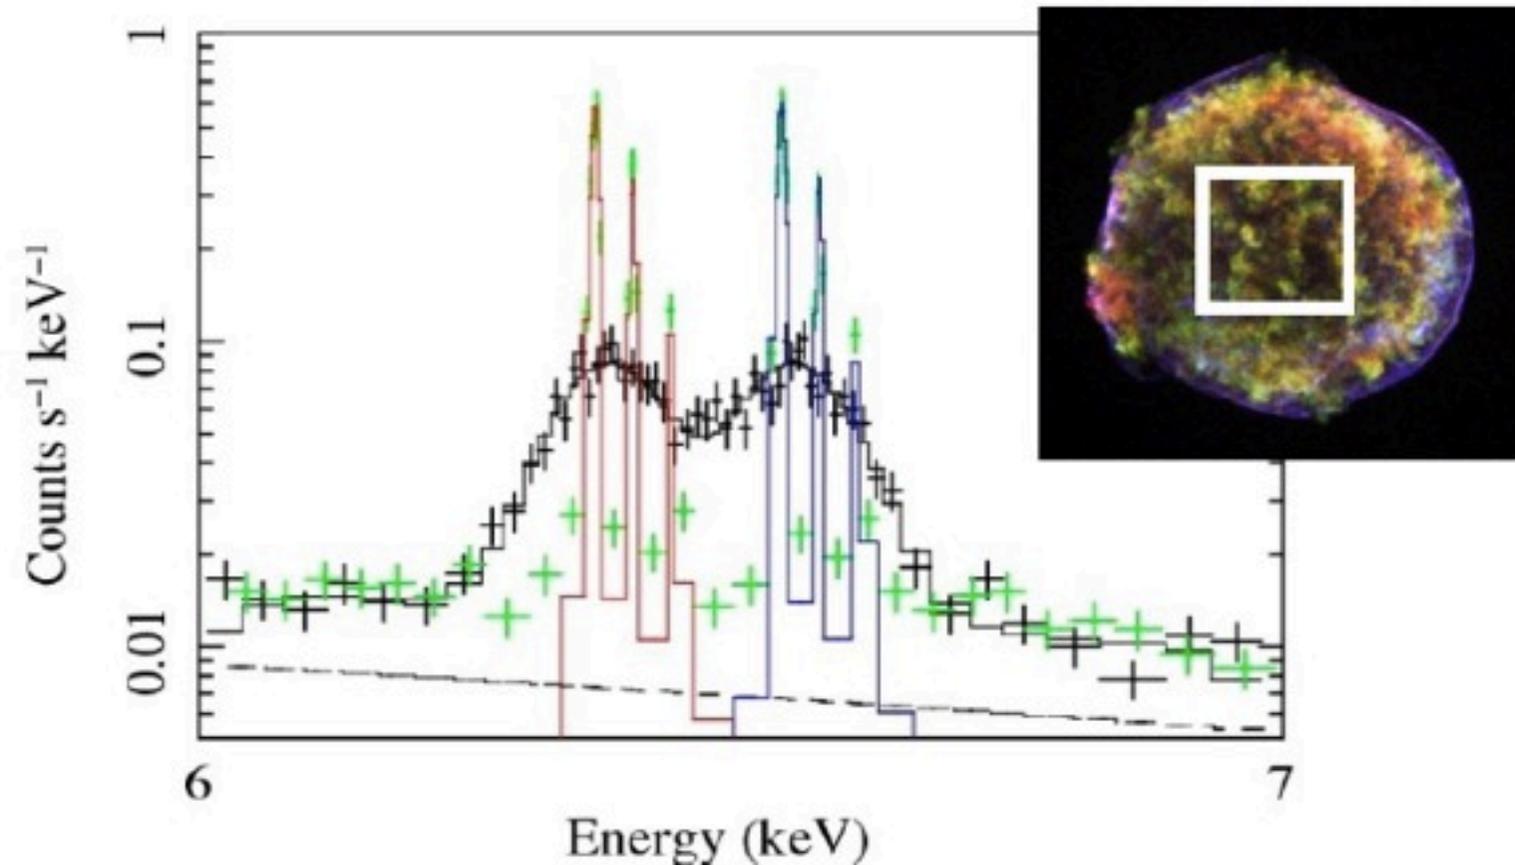

NASA/GSFC/Nagoya/ISAS

For Both SXS and SXI

ASTRO-H Micro Calorimeter Science

Simulated spectra: the Tycho SNR <5-7 eV Energy Resolution>

Simulated spectra of the iron K-shell complex from the inner region of the Tycho SNR with an exposure of 100 ks with SXS/ASTRO-H.

The ion temperature is assumed to be 30 billion degrees (black) or negligible (green). Red- and blue-shifted lines from the fast moving gas can be readily resolved with SXS.

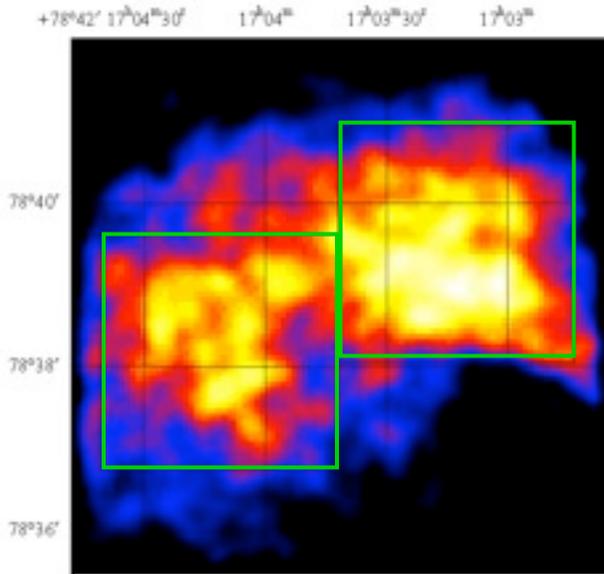

ASTRO-H Micro calorimeter + Hard X-ray Science

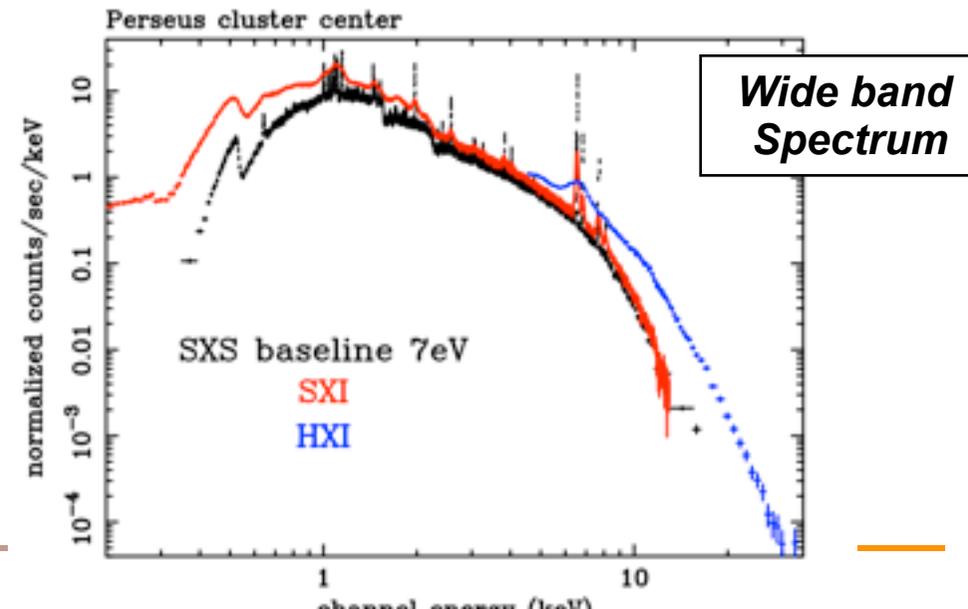

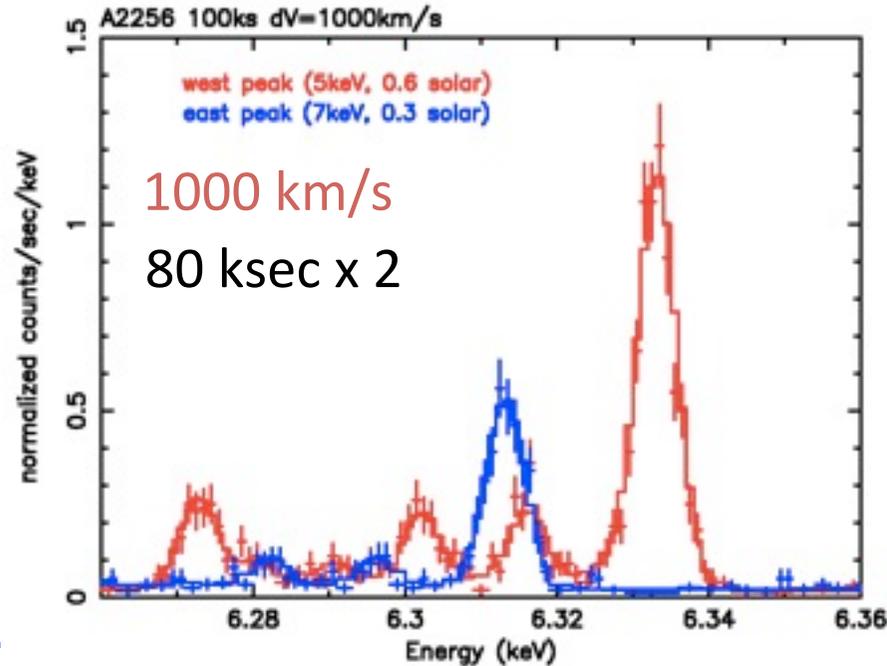

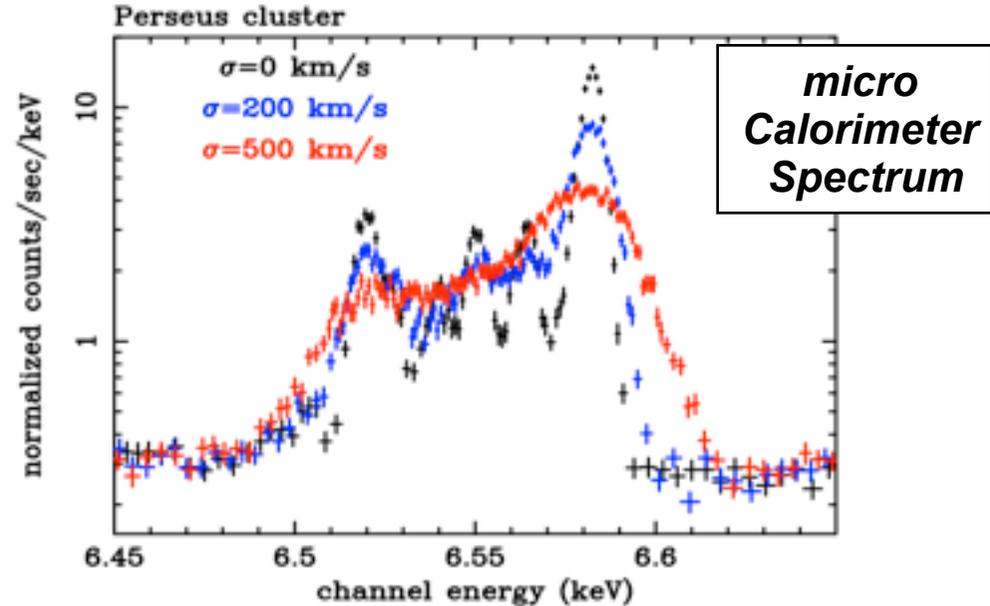

Merging Cluster

A2256

($z = 0.058$)

Perseus cluster ($r < 2'$, 100ks)
vapec 3T (0.6keV, 2.6keV, 6.1keV)

- As the international X-ray observatory in 2010's, ASTRO-H will investigate the physics of the high-energy universe using high-resolution, high-throughput imaging and spectroscopy from 0.3 to 600 keV.
- ASTRO-H will push on X-ray astronomy to a new exciting phase by showing dynamical motions with a micro-calorimeter. Direct measurement of velocity field.

ASTRO-H is now in Phase C.

Next major step is the CDR (critical design review) in June/July 2011 for the planned launch year of 2014.

Simulation Tools are available from

<http://astro-h.isas.jaxa.jp>

ASTRO-H Team

(more than 160 scientists are involved in the project)

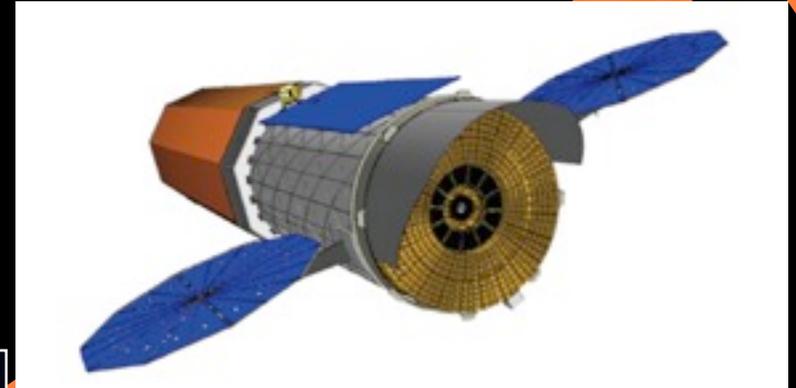

The image shows the ASTRO-H logo on the left, which features a stylized satellite in space with the text "X-RAY OBSERVATORY ASTRO-H". To the right of the logo is a list of participating institutions and their national flags. The list is organized into three columns. At the bottom of the list are the logos for JAXA, NASA, and several national flags (Japan, USA, Hungary, Switzerland, Ireland, UK, France, Canada, ESA). The date "2011.2.14" is printed in the bottom right corner.

One more Summary

The Japanese X-ray community regards the IXO mission as the next major X-ray program in Japan, following ASTRO-H.

IXO

$6500\text{cm}^2 @ 6\text{keV}$

The ISAS Space Science Committee approves that the IXO team in Japan can join the study activity on IXO during the definition phase, if the IXO mission is approved to proceed to the next phase in the down selection process of the Cosmic Vision.

ASTRO-H

$210\text{cm}^2 @ 6\text{keV}$
for micro-calorimeter

Suzaku
